

# CARE INSTRUCTIONS USER GUIDE

## Best Practices For Laundering Sheets Like Commercial Laundries

### PROPER SORTING

**Color Type:** Separate colored ones to prevent color bleeding.

**Fabric Type:** Sort sheets by fabric type to ensure each fabric receives the correct washing treatment.

### PRE-TREATMENT

**Spot-Treat Stains:** Apply a stain remover before washing to prevent stains from setting in during the wash cycle.

### WASHING CYCLE

**Water Temperature:**

**Sheet:** Wash temperature range should be between 135°F/57°C and 143°F/63°C.

**Cycle Time:** A standard wash cycle for sheets should last about 32 minutes.

### DETERGENT AND CLEANING SOLUTIONS

**Detergent:** High-quality, industrial-grade detergents are designed for commercial laundries and formulated to handle large loads and tough stains.

**Bleach:** Bleach when needed.

### DRYING CYCLE

**Temperature:** Dry at about 140°F/60°C to ensure thorough drying.

**Drying Time:** A typical drying cycle until dry. Check sheets periodically to prevent over-drying and remove them promptly once dry to avoid wrinkles.

### IRON:

Iron at 230°F/110°C when needed.

## DO'S & DON'TS

- **DO** Use Appropriate Detergents: Choose detergents specifically formulated for commercial use to ensure effective cleaning and fabric care.
- **DO** Regular Maintenance: Regularly maintain and clean laundry equipment to ensure optimal performance and prevent contamination.
- **DON'T** Overload Machines: Overloading washing machines can lead to inadequate cleaning.
- **DON'T** Use Excessive Chemicals: Excessive use of harsh chemicals can damage fibers and reduce their lifespan.
